Sports Gambling

- **Point Spread:**

Golden State Warriors	+ 6.5	1.909
Sacramento Kings	- 6.5	1.909

- **Over/Under:**

Capitals vs Penguins	Over	5.5 goals	1.90
Capitals vs Penguins	Under	5.5 goals	1.90

- **Other Props:**

Belichick Hoodie Colour	Blue	1.92
Belichick Hoodie Colour	Grey	1.92

Profitable Systems

- A gambling system (often found in sports) is profitable with
  - Wager of size $x
  - System win probability p
  - Return of $x • θ on a win and 0 on a loss

If

$$(-x)(1-p)+(x\theta-x)p>0\rightarrow p>1/\theta$$

The Kelly Criterion

- The Kelly criterion (Kelly 1956) provides a gambler an optimal fraction of a bankroll for wagering given probability p of winning a bet.

$$k(p) = \begin{cases} \frac{p\theta - 1}{\theta - 1} & p > 1/\theta \\ 0 & p \leq 1/\theta \end{cases}$$

- **Problem:** Experienced gamblers claim $k(p)$ is too large
- **Reason:** p is not known and often overestimated with data
- **The Fix:** Model the unknown parameter p and estimate the unknown $k(p)$ with the estimator $f = f(x)$

Modified Kelly Criterion

- To assess the quality of f we use $l_i(f, p)$ as loss function i
- Use a Bayes estimator f which minimizes the Bayes risk
  - Will minimize expected posterior loss

$$G(f) = \int_0^1 l_0(f, p)\pi(p \mid x)dp$$

- Posterior distribution of p is defined by
  - historical data $x \sim \text{Binomial}(n, p)$ from historical win/loss data
  - prior distribution $p \mid \sim \text{Beta}(a, b)$
- For different loss functions (see poster) we get different f
  - Can be solved for directly or by estimating the integral through computation

In Practice

- **Find a Winning Gambling System**
  - Professor MJ's push-back phenomenon in NBA playoff games point spread system with 271/484 = 0.56 win rate.
- **Define Beta distribution with *a* and *b*:**
  - $a = b = 50$
    - Centered at 0.5, and ~ 95% of the prior probability in the interval (0.4, 0.6)
- **Choose loss function:**
  - $l_{3b}(f, p) = (I_{f > k(p)} + 2)\,|f - k(p)|^{1.5}$ - lies halfway between absolute error loss and squared error loss. Penalty of overestimation is 1.5 times worse than underestimation
- Starting with an $1000 bankroll would have produced a final bankroll of
  - Original Kelly: $668.34, using 7.6% of initial bankroll for each bet
  - Modified Kelly: $794.89, using 4.7% of initial bankroll for each bet
